

## 과제 목표

이번 과제는 내가 쌓은 모델과 resnet18을 전이학습으로 학습하였을 때 나오는 Loss와 Accuracy를 비교하는 과제이다.

## 구현 방법

```
class Strategy1(nn.Module):  
    def __init__(self, num_classes=2):  
        super(Strategy1, self).__init__()  
        self.model = models.resnet18(pretrained=True)  
        model_fc = self.model.fc.in_features  
        self.model.fc = nn.Linear(model_fc, num_classes)  
  
    def forward(self, x):  
        return self.model(x)
```

```
(avgpool): AdaptiveAvgPool2d(output_size=(1, 1))  
(fc): Linear(in_features=512, out_features=1000, bias=True)
```

Resnet18의 경우 마지막 fully connected layer의 output이 1000개이고, 우리의 데이터셋은 2개의 class를 분류하는 것이므로 output을 2개로 바꿔주었다.

또한 Strategy1의 경우 전체 파라미터를 학습하는 것 이기 때문에 freeze를 하지 않았다.

그 결과 다음과 같이 나왔다.

```

class Strategy3(nn.Module):
    def __init__(self, num_classes=2):
        super(Strategy3, self).__init__()
        self.model = models.resnet18(pretrained=True)

        for param in self.model.parameters():
            param.requires_grad = False

        model_fc = self.model.fc.in_features
        self.model.fc = nn.Linear(model_fc, num_classes)

    def forward(self, x):
        return self.model(x)

```

Strategy3의 경우 classifier만 새로 학습하도록 모든 파라미터를 `requires_grad = False`로 하고

Fully connected layer를 변환해 주었다. 새로 변환될 경우 자동으로 `requires_grad = True`가 된다.

확실히 학습된 모델을 사용할 경우 학습을 처음 시작할 때부터 정확도가 높은 것을 볼 수 있다.

strategy3의 경우 초반의 정확도가 다소 낮는데 학습이 진행됨에 따라 올라가는 것을 볼 수 있다.

Resnet18의 학습 데이터와 우리의 학습 데이터가 매우 비슷하다는 것을 볼 수 있다.
